

SPEED's New 64 Bit Offering

FOR IMMEDIATE RELEASE –

November 17, 2005 – In response to the CAD industry's demand for ever increasing speed and faster data management, Speed Consulting has introduced the Mach 1 engineering workstation, their first entry into 64-bit architecture.

Although the core business for Speed Consulting comes from product design consulting and software sales, they have been building computers for quite some time. Clients have called asking for a Speed version of what users refer to as "the killer machine".

"Our customers grow our company" says Randy Speed, founder and president of Speed Consulting, LLC. "they have demanded a 64 bit offering, and we are responding with the Mach 1."

Speed says that users benefiting the most from the Mach 1 will be those dealing with large assemblies, real-time rendering and animation, and computational analysis like finite element or fluid flow. But the advantages of the Mach 1 don't stop with number crunching and graphics data.

There are noticeable improvements in other areas as well. "It's not just the fact that 64 bit handles larger chunks of information" says Speed, "We have researched the industry and combined the fastest, most reliable hardware available into an affordable and fast machine."

Speed Consulting's engineers went one step further than simply building a serious engineering machine. Close attention was paid to system reliability and redundancy. They know the importance of your data, and have balanced performance with reliability.

"It's not really about 64 bit", says Speed. The Mach 1 represents all that has helped Speed Consulting succeed in their consulting business. "We are perfectionists, but demand quality at a reasonable price." The 64 bit aspect definitely matters, but customers get a machine that is built with the most reliable, and rugged components available.

The Mach 1 also heals itself at night. With specific applications and optimum settings, the technicians at Speed Consulting are watching after you even after the sale. They wanted to provide a computer system that will maintain top performance months and years after it is initially put into service.

"We set these applications up after loading the operating system" says Speed. Depending on the time zone where the computers will be delivered, they are programmed to automatically optimize the hard drives when the users are at home asleep. This keeps the systems performing like new.

If you are looking for a 64 bit computer that balances price, performance, and reliability, perhaps the Mach 1 is the "killer" machine you are looking for.

Speed Consulting is a limited liability corporation based in Waxahachie, Texas
